Alabama

Strategic IT Landscape and Market Analysis Report

April 2, 2026

1. Executive Summary & Macro Landscape

The State of Alabama represents a highly dynamic and rapidly modernizing State and Local Government (SLG) market, currently navigating an unprecedented era of economic expansion alongside an aggressive, centralized push toward secure digital infrastructure. Under the continued leadership of Governor Kay Ivey (R), the state's political and economic climate is exceptionally stable, intensely pro-business, and focused on long-term capital investments that are fundamentally reshaping the state's demographic and technological footprint. The administration has fostered an economic transformation that has secured over $69 billion in capital investments and generated more than 100,000 jobs since 2017.[1] The state consistently ranks in the top ten nationally for its business climate, buoyed by favorable property taxes, a cooperative regulatory framework, and aggressive workforce training programs such as the Alabama Industry-Recognized and Registered Apprenticeship Program (AIRRAP).[3]

Economically, Alabama is experiencing sustained momentum across advanced manufacturing, aerospace, defense, and biosciences. Landmark commercial projects, such as Eli Lilly and Company's $6 billion advanced pharmaceutical manufacturing plant in Huntsville and Georgia Pacific's $800 million expansion in Monroe County, underscore the state's capacity to attract high-compute, high-data commercial partners into both urban hubs and targeted rural counties.[1] While recent demographic analyses by the University of Alabama's Center for Business and Economics Research indicate a slowing natural population growth rate—with deaths exceeding births for the first time since tracking began in 1930—positive net migration continues to fuel a robust labor market and overall economic growth of approximately 2.3 percent.[6] From a fiscal perspective, the state relies on two constitutionally distinct budgets—the Education Trust Fund (ETF) and the State General Fund (SGF). Both funds have experienced historic surpluses in recent fiscal cycles, though legislative leaders are now adopting highly conservative growth caps to insulate the state against future federal funding drop-offs and inflation.[7]

For the current and upcoming fiscal years, the administration's top priorities heavily intersect with enterprise technology, digital transformation, and statewide connectivity. The most critical administrative goals driving state policy and procurement include:

The absolute foremost priority for the administration in the current legislative session is public safety, encompassing both physical law enforcement and statewide digital resilience. Following a near-miss, highly sophisticated cyber incident that nearly crippled critical state infrastructure in 2025, public safety has expanded beyond traditional policing to include sweeping cybersecurity standardization across all state agencies.[10] The administration is backing a comprehensive package of tough-on-crime measures, including bans on firearm conversion devices and automatic sentence enhancements, while simultaneously pushing for the modernization of criminal justice information systems and the deployment of advanced surveillance and automated speed enforcement technologies in highway work zones.[10]

Equally critical is the state's monumental push toward economic development through

broadband infrastructure expansion. The state views high-speed internet as foundational infrastructure required to power workforce development and upward mobility. Alabama recently secured approval from the Trump Administration for $460 million through the federal Broadband Equity, Access, and Deployment (BEAD) program to provide last-mile connectivity to 92,000 unserved locations across 63 projects.[78] This is occurring in tandem with the Alabama Fiber Network (AFN), a 3,500-mile middle-mile fiber backbone spanning all 67 counties that was scheduled for full completion in February 2026, enabling critical anchor institutions like hospitals, schools, and public safety buildings to access high-speed enterprise networks.[79]

Finally, the administration is deeply focused on education reform and digital equity. Initiatives such as the CHOOSE Act, which establishes universal school choice via education savings accounts, and the "Strong Start, Strong Finish" workforce development initiative aim to completely overhaul the state's educational outcomes.[4] The state is pushing aggressively to add 500,000 highly skilled workers to the economy by 2025, mandating computer science curriculum access in every high school and aligning community college programs directly with the technological demands of incoming aerospace and biotech industries.[4]

2. Power Structure & Key Stakeholders

Understanding Alabama's power structure requires navigating a bifurcated fiscal landscape and a rapidly centralizing IT governance model. The State Legislature, operating through a bicameral supermajority, maintains strict, austere control over the dual budgets. Legislative appropriators view their primary role as fiscal stewards, routinely capping agency operational budgets to single-digit growth to guard against economic downturns.[7] Conversely, the executive branch—specifically the Office of Information Technology (OIT)—is asserting unprecedented, statutorily backed authority over agency-level technology architectures, forcing agencies to modernize and secure their environments despite the austere budgets handed down by the legislature. This dynamic creates a highly centralized technical decision-making environment, albeit one constrained by rigid legislative purse strings.

Name & Title	Sphere of Influence	Recent Public Stances on Technology
Kay Ivey Governor (R)	Elected Leadership *(Financial & Policy Approver)*	Views technology as a core pillar of economic development and public safety. Issued Executive Order 738 creating the GenAI Task Force in early 2024. Subsequently, in February 2026, she formally established the Technology Quality Assurance Board (TQAB) in accordance with Act 2025-369 to govern AI and emerging tech implementation across the executive branch.[76]
Rep. Rex Reynolds Chair, House Ways & Means General Fund	Elected Leadership *(Financial Purchaser)*	Advocates for highly conservative, flat-growth budgeting, explicitly targeting approximately 1% growth in the FY2027 General Fund to prepare for post-COVID federal funding cliffs. Prioritizes targeted spending for law enforcement technology, district attorneys, and infrastructure over broad agency operations and maintenance increases.[7]
Sen. Greg Albritton Chair, Senate Finance & Taxation General Fund	Elected Leadership *(Financial Purchaser)*	Drives stringent fiscal accountability and oversight in the upper chamber. Oversaw the passage of the largest General Fund budgets in state history but consistently warns of dwindling returns, demanding demonstrable return on investment for all capital expenditures and state agency funding requests.[9]
Daniel Urquhart Secretary of IT / State CIO	IT Leadership *(Technical Influencer & Approver)*	Promotes a strict "whole-of-state" strategy to eliminate decentralized, shadow IT deployments. Following recent cyber threats, he is highly critical of agency autonomy in procuring custom infrastructure and demands absolute standardization, consolidated service catalogs, and strict emerging technology governance.[11]

Name & Title	Sphere of Influence	Recent Public Stances on Technology
Chadwick Smith State CISO	IT Leadership *(Technical Influencer)*	Spearheads the enforcement of NIST frameworks and StateRAMP/GovRAMP compliance for all vendors. Champions zero-trust architectures, Threat Management Center build-outs, and proactive defense mechanisms—such as statewide tabletop exercises—across all 67 counties and multiple levels of local government.[21]
Mason L. Tanaka CIO, Alabama Medicaid Agency	Agency IT Leadership *(Technical Influencer & Purchaser)*	Leading the state's largest IT modernization effort (AMMP). Advocates heavily for modular, interoperable cloud ecosystems, enterprise data warehouse expansion, and a deliberate "crawl, walk, run" approach to deploying artificial intelligence in clinical data analytics and claims processing.[23]

3. IT Governance & Service Delivery Model

Historically, the State of Alabama operated under a highly federated IT model, where individual departments and agencies possessed significant autonomy to design, build, procure, and manage their own technology platforms and localized data centers.[11] This decentralized approach led to massive technical debt, redundant software licensing, sprawling unstructured data environments, and severe security vulnerabilities across the executive branch. However, the current service delivery model is undergoing a violent acceleration toward a consolidated and hybrid approach, mandated and enforced by the Office of Information Technology (OIT). First established in 2013 to centralize IT policy and strategic planning, OIT has spent the last decade gradually building its service catalog, but has only recently acquired the statutory teeth necessary to force compliance upon autonomous agencies.[25]

This centralization effort accelerated dramatically following a near-miss, highly sophisticated cyber incident in mid-2025. A late-night alert from the federal Cybersecurity and Infrastructure Security Agency (CISA) to Alabama CISO Chad Smith exposed the critical vulnerabilities inherent in Alabama's patchwork, decentralized infrastructure.[11] The incident proved that attempting to protect a state network where agencies maintain significant autonomy over their own firewalls, endpoints, and data storage is an operational impossibility. In direct response to this 95-hour crisis, CIO Daniel Urquhart and CISO Chad Smith aggressively curtailed

agency-level rogue procurement, transforming the push for standardization from an aspirational goal into an urgent, unyielding priority.[11]

The legislative branch recognized this vulnerability and subsequently passed Act 2025-369 (formerly House Bill 207), which formally consolidated cybersecurity oversight beneath OIT and stripped agencies of their historical autonomy.[76] This legislation empowers OIT to develop cybersecurity insurance frameworks, enforce network segmentation requirements, and govern the implementation of artificial intelligence.[29] To fulfill the GenAI Task Force's recommendations, the formal establishment of the Technology Quality Assurance Board (TQAB) in February 2026 further solidifies this consolidated model. The board includes representatives from heavyweight agencies such as Medicaid, Transportation, Law Enforcement, and Revenue, ensuring that no agency can procure or deploy emerging technologies without OIT's architectural approval and rigorous security vetting.[76]

While the governance model is now firmly consolidated at the policy level, the financial execution of this model creates substantial operational friction. OIT operates essentially as a managed service provider to executive branch agencies, utilizing an extensive Service Catalog that functions on a strict chargeback model.[30] Agencies are billed for discrete, consumption-based services ranging from basic network port access and virtual server hosting to highly complex offerings like Dedicated SQL Server Instance Administration (Charge Code 9010) and Enterprise Content Management user licenses.[30] OIT establishes these rates based on enterprise-grade security standards, maintaining high availability, 24/7 network operations center monitoring, and compliant data hosting.[30]

The friction arises at the intersection of OIT's mandatory enterprise rates and the state legislature's austere budgeting practices. Because legislative appropriators like Representative Rex Reynolds and Senator Greg Albritton routinely flat-fund or strictly cap the operational budgets of smaller state agencies—often restricting year-over-year growth to a mere 1 percent—these agencies simply lack the internal recurring operational budgets (O&M) to afford OIT’s premium services.[7] Agencies are caught in a vise: they are legally required to modernize and secure their environments under OIT's new mandates, but they are not provided the necessary appropriations from the General Fund to pay OIT's chargeback invoices.

If agencies fail to pay or dispute OIT chargebacks, state legislative auditors and department guidelines explicitly state that severe sanctions or financial penalties can be imposed if the chargeback is not resolved within 60 days.[34] To circumvent these mounting enterprise costs, agencies historically attempted to procure cheaper, non-compliant third-party cloud tools or bare-metal servers using independent purchase orders. OIT is now actively suffocating this practice through the rigid enforcement of IT Procurement Policy 230, which requires OIT Information Services Division approval for all hardware, software, and IT professional services purchases across the executive branch.[11] This dynamic creates a highly tense internal battlefield, presenting a unique opportunity for vendors who can offer creative, predictable consumption models that satisfy OIT's architectural demands without breaking the agencies'

fragile O&M budgets.

4. Financials & Budget Breakdown

Alabama's financial architecture is unique among state governments, as the state constitutionally divides its finances into two distinct, siloed budgets: the Education Trust Fund (ETF), which relies heavily on volatile income and sales taxes to fund K-12 and higher education, and the State General Fund (SGF), which utilizes a patchwork of smaller taxes and fees to fund non-education executive, legislative, and judicial agencies.[36] The state operates on an annual budget cycle, with the fiscal year boundaries running from October 1 through September 30.[37] By law, the legislature must pass a balanced budget and is strictly prohibited from carrying a deficit into the following fiscal year, driving a culture of fiscal conservatism.[36]

For Fiscal Year 2027, the state's financial posture remains robust but cautious. The proposed and recently advanced FY 2027 budgets allocate approximately $10.5 billion to the ETF, representing a 5.8 percent increase aimed at generational investments in school choice and teacher retention, and $3.74 billion to the SGF, representing a highly conservative 1 percent increase over the actual FY 2026 budget.[7] For historical context, the enacted FY 2025 budget sat at $9.3 billion for the ETF and $3.4 billion for the SGF.[36] When combined with federal transfers, bonds, and other state funds, Alabama's total state expenditures routinely exceed $43 billion annually.[36] Despite healthy revenue collections and record-level balances in the state's Rainy Day Accounts, legislative leaders are actively suppressing budget growth to prepare for the exhaustion of COVID-era federal relief funds and to offset inflationary pressures across state operations.[7]

Budget execution dictates a strict delineation between recurring operational spend and net-new project investments. Recurring operational expenditures (O&M)—which include software licensing, cloud subscriptions, and OIT chargeback fees—are categorized under Expense Objects such as 0800 (Professional Services) and 0900 (Supplies and Operating Expenses).[40] These funds are closely monitored and strictly capped by the legislature. Conversely, large-scale modernization efforts are categorized under Object 1200 (Capital Outlay). Capital Outlay applies exclusively to technology infrastructure, servers, and hardware exceeding $5,000 per unit with a useful life of more than one year.[40] Funds are released to agencies in quarterly allotments based on an approved Operations Plan. Because agencies cannot carry forward unspent General Fund appropriations, there is traditionally a massive surge in procurement activity during Q3 and Q4 (April through September) as agencies scramble to exhaust their annual appropriations before the September 30 expiration.[40]

Exact enterprise IT budget figures are unavailable as a singular line item.[40] The state does not consolidate its total technology spend into one metric; rather, IT expenditures are embedded deeply within individual agency Capital Outlay and Professional Services lines. However, the sheer scale of ongoing transformation projects, such as the Medicaid AMMP, dictates that hundreds of millions of dollars in dedicated IT spending are programmed into the state's

long-range quadrennium plans over the next decade.[42]

Beyond state tax revenues, Alabama is currently managing massive, historic influxes of federal grant dollars specifically earmarked for technology modernization, cybersecurity, and connectivity. These federal funds bypass standard legislative austerity measures and represent the most lucrative pools of available capital:

- **State and Local Cybersecurity Grant Program (SLCGP):** Passed under the federal Infrastructure Investment and Jobs Act (IIJA), Alabama was allocated approximately $19 million over four rounds of funding (FY22-FY25) to address critical cyber threats facing state and local governments. OIT serves as the State Administrative Agency distributing these funds, utilizing them to conduct tabletop exercises, deploy endpoint detection, and raise the collective cybersecurity posture of resource-constrained municipalities. For FY 2024 (Round 3), $4.73 million is actively available with a pending 30 percent cost-share waiver. For FY 2025 (Round 4), $1.55 million is designated, requiring a strict 40 percent local cost-share match.[45]
- **Broadband Expansion (BEAD & CPF):** The state is currently executing the largest telecommunications infrastructure buildout in its history. Alabama's $460 million Broadband Equity, Access, and Deployment (BEAD) final proposal was recently approved by the Trump Administration, allowing the state to move forward with awarding grants to connect 92,000 unserved locations.[78] This is occurring concurrently with the deployment of an additional $176 million from the Capital Projects Fund (CPF). These massive capital injections are actively being awarded to internet service providers and local cooperatives to build out edge computing environments, secure network hubs, and the 3,500-mile Alabama Fiber Network, which was scheduled for full completion in February 2026.[79]

5. Strategic Initiatives & Projects

The State of Alabama is currently executing several massive, multi-year technological transformation initiatives designed to completely overhaul its legacy infrastructure. The top three most heavily funded and strategically critical modernization efforts are detailed below.

Initiative 1: Alabama Medicaid Enterprise Systems Modernization Program (AMMP)

Driven by strict federal mandates from the Centers for Medicare & Medicaid Services (CMS), the State of Alabama is entirely deprecating its monolithic, aging legacy system—the Alabama Medicaid Management Information System (AMMIS).[47] In its place, the state is procuring and implementing a highly modular, interoperable, and agile ecosystem known as the AMMP. This initiative is owned by the Alabama Medicaid Agency (AMA), under the technical direction of CIO Mason Tanaka, and represents the highest-spend IT project in the state's portfolio, utilizing a highly favorable 90/10 federal matching funds structure.[23]

The underlying IT requirements for the AMMP are staggering in their complexity and scale. The

program demands the procurement and integration of multiple distinct modules, including Enterprise Data Services (EDS), Systems Integration (SI), Provider Management (PM), Claims Processing and Management Services (CPMS), and Modular Electronic Visit Verification (MEVV).[23] The foundational requirement is the build-out of the EDS module, which acts as the central enterprise data warehouse. This warehouse must be capable of ingesting, transforming, and analyzing vast quantities of unstructured and structured clinical data from disparate external sources, including lab results, admission and discharge transfers, and chronic condition data warehouses.[47]

The Request for Proposals (RFPs) for these modules explicitly demand solutions that offer infinitely scalable capacity—both up and down—for compute, storage, and communication traffic. The infrastructure must provide absolute fault tolerance, high availability, and zero single points of failure.[42] Furthermore, because the system processes vast amounts of Protected Health Information (PHI) and Personally Identifiable Information (PII), the underlying architecture must meet stringent HIPAA compliance standards, and the agency explicitly dictates that all stored data must be physically located within the continental United States (CONUS), heavily restricting off-shore cloud deployments.[51] The AMA is also actively laying the groundwork to integrate artificial intelligence into this ecosystem to combat fraud, waste, and abuse, though leadership emphasizes a measured, risk-averse "crawl, walk, run" approach to deploying AI in clinical settings.[24]

Initiative 2: Message Switch System (MSS) Modernization Project

Owned by the Alabama Law Enforcement Agency (ALEA), this initiative focuses on ensuring mission-critical public safety communication and intelligence sharing across local, state, and federal law enforcement entities. ALEA was formed in 2015 through the consolidation of several independent state policing agencies, which resulted in a tangled web of disparate criminal justice information systems and automated fingerprint identification networks.[53] The agency's existing, legacy CPI-based Message Switch System is aging rapidly and is no longer capable of handling the volume, speed, and modern data integration demands required by contemporary law enforcement.[53]

The underlying IT requirement is the procurement, design, and implementation of a Commercial Off-The-Shelf (COTS), fully managed MSS hosted in a highly secure U.S. Government Cloud environment, with Microsoft Azure Government explicitly listed as the preferred deployment architecture.[55] The RFP for this massive modernization project officially closed on March 31, 2026, meaning the agency has transitioned into the vendor evaluation and selection phase.[55] The infrastructure demands for this project are uncompromising. The vendor must provide an active-active disaster recovery and continuity of operations (DR/COOP) configuration spread across geographically separated sites within the United States.[53] The system must guarantee 24/7/365 absolute uptime to support field troopers and dispatchers. Furthermore, the entire compute, storage, and network stack must achieve absolute, audited compliance with the FBI's Criminal Justice Information Services (CJIS) security policies, necessitating ultra-low latency compute, impenetrable edge security, and highly resilient,

immutable storage solutions.[53]

Initiative 3: Statewide AI Governance and Enterprise Cloud Readiness

Executed via Governor Kay Ivey's Executive Order 738 (which created the GenAI Task Force in 2024) and the subsequent formal establishment of the Technology Quality Assurance Board (TQAB) in February 2026, Alabama is building a secure, ethical framework to deploy Generative AI (GenAI) across all executive branch operations.[76] The executive mandate driving this initiative is the need to modernize citizen service delivery, automate highly repetitive administrative tasks, and mitigate severe workforce shortages across state government.[56] This initiative is jointly owned by the Office of Information Technology (OIT) and the Department of Finance.

The underlying IT requirement for this initiative represents a massive shift in how the state manages its enterprise architecture. Prior to deploying any AI models, OIT is mandated to establish highly secure, isolated "sandbox" cloud infrastructures that allow state agencies to run GenAI pilot projects safely without exposing citizen PII to public Large Language Models (LLMs).[58] This necessitates a comprehensive overhaul of the state's unstructured data management practices and the implementation of the National Institute of Standards and Technology (NIST) AI Risk Management Framework (AI RMF).[59] Furthermore, to govern exactly who can access and feed data into these models, OIT is undertaking a massive identity and access management (IAM) modernization, prioritizing deployments within their existing Microsoft GCC tenant before carefully expanding to other platforms.[22]

6. Procurement, Vendor Landscape, & Compliance

Procurement Vehicles & Methods The State of Alabama relies on highly structured, rigorously regulated procurement pathways overseen jointly by the Department of Finance's Division of Purchasing and OIT. Governed by Title 41 of the Code of Alabama, state agencies are legally required to utilize free and open competitive bidding processes for any non-exempt hardware, software, or services purchase involving $15,000 or more.[35] The state's primary purchasing mechanism is the **Alabama Buys** portal, supplemented heavily by the **Alabama Joint Purchasing (ALJP)** program, which establishes pre-negotiated, cooperative agreements specifically tailored for technology and educational acquisitions.[62]

To streamline the acquisition of enterprise technology and bypass lengthy RFP cycles, the state actively leverages national cooperative purchasing vehicles. Alabama extensively utilizes NASPO ValuePoint—specifically relying on the Software Value Added Reseller (SVAR) contracts for broad software procurement—alongside other recognized consortiums including OMNIA Partners, the National Cooperative Purchasing Alliance (NCPA), and PEPPM.[62]

The Battlefield: Incumbents & Vulnerabilities

The Alabama IT infrastructure landscape is fiercely competitive, heavily populated by entrenched legacy providers, yet simultaneously ripe for aggressive modernization

interventions.

- **Compute & Storage:** The core infrastructure battlefield is defined by the state's Master Agreement for Servers & Storage Solutions (MA230000004192). Under this massive vehicle, the state has approved direct contracts for Hitachi, Hewlett Packard Enterprise (HPE), and Nutanix.[64] In the dedicated storage and backup arena, Pure Storage, Commvault, and Veeam hold notable, deeply embedded footholds, often sold through dominant regional value-added resellers like Mainline Information Systems.[64]
- **Dell's Current Footprint:** Dell Technologies maintains a massive, direct cooperative agreement footprint in the state. Specifically, the ALJP2022-081 Dell Hardware Agreement establishes a formidable beachhead, providing agencies direct access to Dell's portfolio of endpoints, servers, and enterprise infrastructure without secondary vendor markup.[62]
- **Security & Networking:** The network perimeter and endpoint security environments are heavily dominated by Cisco, Palo Alto Networks, SentinelOne, and Fortinet, all of which hold dedicated state master agreements.[64]
- **Modernization Vulnerabilities:** Despite these entrenched contracts, immense vulnerabilities exist within competitor deployments. Across the state, numerous mid-tier agencies are burdened by aging, on-premises data centers, legacy mainframes, and outdated physical firewalls that OIT is actively seeking to forcibly consolidate, virtualize, or retire.[68] The push to abandon these legacy physical environments presents immediate rip-and-replace opportunities for modern hyperconverged infrastructure.

Compliance Drivers

Purchasing decisions in Alabama are no longer dictated merely by price; they are now governed by rigid, newly enforced compliance frameworks that act as absolute barriers to entry for non-compliant vendors:

- **GovRAMP (formerly StateRAMP):** In a major policy shift, Alabama formally adopted StateRAMP (rebranded as GovRAMP in early 2025) to standardize vendor cybersecurity measures. Any cloud service provider (CSP) or vendor housing state data must possess a GovRAMP Authority to Operate (ATO), verifying strict alignment with NIST 800-53 security controls.[71] Vendors lacking this certification are disqualified from enterprise-level procurements.
- **CJIS & HIPAA:** Essential for massive procurements like ALEA's Message Switch System and Medicaid's AMMP, these federal standards dictate strict data encryption protocols, active-active disaster recovery setups, and absolute U.S.-based, sovereign cloud or secure on-premise data handling.[53]
- **NIST AI-RMF:** Under OIT's newly published Artificial Intelligence Governance Policy (AI-GV-P1), any vendor proposing AI tools or machine learning analytics to a state agency must explicitly map their solution to the NIST AI Risk Management Framework. This mandates that vendors prove transparency, demonstrate bias mitigation, and ensure that

citizen data is never used to train public models.[24]

7. Actionable Dell Opportunities

To capture significant market share, bypass entrenched competitors, and elevate Dell Technologies from a transactional hardware vendor to a strategic enterprise partner within the State of Alabama, Account Executives and District Managers must execute the following targeted sales motions:

- **Funded Alignment: Capitalize on AMMP Data Warehousing and ALEA DR Architectures.** The Alabama Medicaid Agency is actively procuring massive modular systems (Enterprise Data Services, Systems Integration, Claims Processing) that require unprecedented, scalable storage and compute capabilities.[42] Dell must align **Dell PowerEdge** servers and **PowerStore** arrays directly to the prime systems integrators bidding on these AMMP modules, positioning Dell as the underlying, HIPAA-compliant, CONUS-restricted infrastructure provider of choice. Simultaneously, ALEA's strict requirement for an active-active, highly resilient Message Switch System (MSS) [53] presents a prime opportunity to position **Dell APEX** and **PowerProtect Data Manager**. By pitching a CJIS-compliant, sovereign hybrid-cloud disaster recovery architecture, Dell can ensure ALEA meets its 24/7/365 uptime mandate without relying entirely on vulnerable public hyperscalers.
- **Whitespace & Advisory: Lead with AI Data Governance and Secure Edge Inferencing.** Governor Ivey's creation of the Technology Quality Assurance Board (TQAB) and OIT's strict mandate to implement the NIST AI-RMF highlight a massive, unaddressed blind spot in the state's unstructured data strategy.[75] State agencies are explicitly forbidden from blindly feeding citizen PII into public LLMs, yet they lack the internal expertise to build secure AI environments. Dell must lead with advisory services to conduct comprehensive unstructured data sprawl assessments. This paves the immediate way for **Dell AI-Ready Infrastructure (Validata Designs for Generative AI)**. By positioning Dell as the partner capable of building the secure, on-premises, or private-cloud "sandboxes" required by OIT for agency GenAI pilot projects, Dell ensures that the state's data remains sovereign, compliant, and out of the public cloud.
- **Competitive Displacement: Attack the Chargeback Friction with Predictable APEX Economics.** OIT's strict IT chargeback model creates severe budgetary friction for smaller agencies that are operating on capped, austerity-driven General Fund O&M budgets governed by the legislature.[16] Furthermore, the state relies heavily on aging HPE and Nutanix footprints under Master Agreement MA230000004192, which are vulnerable to lifecycle refreshes.[64] Dell should aggressively target expensive public cloud repatriation initiatives and legacy SAN refreshes by positioning **Dell APEX Custom Solutions**. By offering a cloud-like consumption model for on-premises infrastructure, Dell can shift the financial burden from restricted Object 1200 Capital Outlay to predictable Object 0800/0900 OpEx billing. This flat-rate consumption model aligns perfectly with the 1 percent legislative budget caps, solving the agency chargeback

friction while directly displacing expensive hyperscaler variable costs and legacy competitor hardware.
