State of Maryland

Strategic IT Landscape and Market Analysis Report

SLG Strategy Team

March 18, 2026

1. Executive Summary & Macro Landscape

The State of Maryland is currently operating in a highly dynamic and transformative period under the administration of Governor Wes Moore and Lieutenant Governor Aruna Miller. Positioned uniquely with a highly educated workforce, proximity to the federal government, and a robust network of academic and research institutions, the state's macro environment is characterized by an aggressive, whole-of-government push toward economic competitiveness, social equity, and the modernization of public safety infrastructure.[1] However, this ambitious administrative agenda is being executed against a backdrop of increasingly complex fiscal realities. Legislative analysts and state financial officers have repeatedly highlighted structural budget deficits that have plagued the state since at least 2017.[1] These underlying financial vulnerabilities were temporarily masked by historic influxes of federal COVID-19 stimulus and American Rescue Plan (ARP) funding, which created a temporary "sugar high" of surplus capital.[1] As these federal relief dollars expire and the state returns to baseline revenue projections, the administration is being forced to prioritize fiscal responsibility, executing targeted cost-containment measures, and relying heavily on technological modernization to drive operational efficiencies and eliminate long-term structural waste.[1]

To navigate these dual pressures of fiscal constraint and expansive executive mandates, the Maryland Department of Information Technology (DoIT) has released a comprehensive IT Master Plan spanning the 2025 and 2026 fiscal years. This strategic roadmap formally transitions DoIT from a traditional, decentralized back-office support entity into a highly centralized driver of product-oriented public service delivery.[6] The administration clearly recognizes that modernizing legacy systems is not merely an optional IT upgrade but a fundamental requirement to achieve the state's broader socioeconomic and operational goals.[7] Secretary of Information Technology Katie Savage has publicly stated that information technology must move to the center of how the government drives service delivery, fundamentally altering how the state conceives of its operational processes rather than simply digitizing outdated workflows.[8]

For the current and upcoming fiscal years, the administration's core administrative and technological goals are centered around the following interconnected priorities:

Economic Development & The Innovation Economy: The state is aggressively catalyzing investments in advanced technology sectors to foster job growth and position Maryland as a global leader in emerging industries. This includes a targeted $27.5 million investment in the "Capital of Quantum" initiative—a landmark public-private partnership aimed at cementing the state's dominance in quantum information science—as well as funding for the Baltimore Tech Hub Consortium and a $25 million infusion into the Economic Development Opportunities Program (Sunny Day Fund).[10] Furthermore, the administration has announced groundbreaking partnerships with artificial intelligence organizations, such as Anthropic and Percepta, to deploy AI tools safely across state agencies to improve permitting timelines, housing development, and benefit distributions.[12]

Citizen Experience & Digital Equity: The Moore-Miller administration is heavily focused on overhauling how residents interact with the government, guided by a mandate to "leave no one behind".[3] This is most visibly manifesting in the "Maryland Benefits" initiative (formerly known as "One Application" and MD THINK), which aims to streamline constituent access to critical social benefits—such as the Supplemental Nutrition Assistance Program (SNAP), Medicaid, and Temporary Assistance for Needy Families (TANF)—via a unified, mobile-first digital platform that was recently transferred directly to DoIT for FY 2026. This initiative is not merely about user experience; it is a critical operational necessity designed to address historic friction points and reduce systemic overpayment errors that have recently triggered legislative audits.[14] Concurrently, the state is investing in expansive broadband infrastructure rollouts to close the digital divide and ensure equitable access to these modernized digital services.[9]

Public Safety & Infrastructure Resilience: Enhancing emergency response capabilities and reinforcing physical and digital infrastructure remain paramount. Significant capital is being directed toward upgrading 911 technologies at the local level, including comprehensive Computer Aided Dispatch (CAD) systems, and establishing the Center for Firearm Violence Prevention.[11] On the digital front, the state is executing an aggressive 18-month mandate to implement a statewide zero-trust cybersecurity framework, moving away from outdated perimeter defense models to protect critical state networks, including the networkMaryland fiber backbone, from evolving geopolitical and domestic cyber threats.[8]

Government Efficiency & IT Centralization: Reining in decentralized, redundant IT spending across disparate state agencies is a primary mechanism for balancing the state budget. The current mandate focuses on "thoughtful centralization," which involves decommissioning duplicative legacy platforms, scaling down bespoke agency applications, and implementing enterprise-wide shared services.[8] By reducing the procurement and management burden on individual departments, the state aims to achieve significant economies of scale, lower overall operational costs, and improve the consistency of digital service delivery across the executive branch.[8]

2. Power Structure & Key Stakeholders

Understanding Maryland's enterprise technology landscape requires mapping the spheres of influence of both the elected officials who control the complex appropriations process and the technical leadership responsible for executing the state's ambitious IT Master Plan. The political dynamic in Maryland often features a tension between the executive branch's desire for rapid, centralized technological transformation and the legislative branch's demand for strict financial accountability, particularly in light of historical cost overruns on Major Information Technology Development Projects (MITDPs).[21]

The following table categorizes the primary stakeholders dictating the state's technology trajectory, delineating their roles as financial purchasers versus technical influencers.

Name	Sphere of Influence	Recent Public Stances on Technology
Wes Moore Governor	Financial Purchaser / Executive Mandate	Champions AI enablement, digital equity, and structural modernization. Signed an Executive Order establishing AI governance principles and launched the Maryland Digital Service to overhaul citizen-facing applications and modernize the executive branch.[12]
Brooke Lierman Comptroller	Financial Purchaser / Business Owner	Mandating the modernization of the 30-year-old Financial Management Information System (FMIS). Strongly advocates for replacing legacy systems with modern, cloud-based ERP platforms that strengthen cybersecurity and improve financial transparency across all agencies.[25]
Guy Guzzone Chair, Senate Budget & Taxation Committee	Financial Purchaser / Appropriations	Controls state purse strings and overarching budget legislation. Recently led legislative efforts to transform a projected $1.4B structural deficit into a balanced budget, requiring strict justification for large capital IT expenditures and authorizing cost containment measures.[4]
Ben Barnes Chair, House Appropriations Committee	Financial Purchaser / Appropriations	Oversees funding allocations for state agencies in the lower chamber. Instrumental in reviewing DoIT's budget requests and holding individual agencies accountable for IT project reporting, transparency, and schedule overruns.[22]
Katie Savage Secretary of IT & State CIO, DoIT	Technical Influencer / Strategic Decision Maker	Driving the administration's "thoughtful centralization" mandate. Advocates for a shift from bespoke agency tools to enterprise shared services. Strongly emphasizes zero-trust architecture, product-oriented delivery models, and comprehensive data management.[9]
James Saunders Acting State CISO, DoIT	Technical Influencer / Security Authority	Leading the 18-month rollout of a statewide zero-trust cybersecurity framework. Proponent of continuous authentication, integrating artificial intelligence into security operations, and

		fostering extensive cross-agency collaboration and compliance. *(Note: Serving in an acting capacity until officially confirmed by the Maryland State Senate)*.
Natalie Evans Harris State Chief Data Officer, DoIT	Technical Influencer / Data Strategy	Architect of the comprehensive Maryland Data Governance Policy. Focused on establishing rigorous data handling protocols, breaking down agency data silos, and preparing both structured and unstructured data repositories for AI readiness.[31]
Subramanian Muniasamy CTO, Dept. of Human Services (DHS)*	Technical Influencer / Agency Implementation	Key architect behind MD THINK (Maryland's Total Human-services Information Network). Drives massive cloud modernization for health and human services delivery. *(Note: DHS recently posted a recruitment for the CTO role, indicating a potential ongoing leadership transition)*.[13]
Clint Hackett CIO, Dept. of Health (MDH)	Technical Influencer / Agency Implementation	Oversees enterprise technology and IT operations for the state's massive health department, previously a co-owner of the MD THINK platform before its transfer to DoIT.
Shafiq Rahman CIO, Dept. of Transportation (MDOT)	Technical Influencer / Agency Implementation	Oversees technology for a highly complex, infrastructure-heavy agency. Focuses on legacy CAD systems, intelligent transportation systems, and managing vast amounts of edge/sensor data for state highways and transit.[34]
Amaro S. Thiam Acting CIO, Dept. of Public Safety (DPSCS)	Technical Influencer / Agency Implementation	Manages IT infrastructure for correctional facilities, parole, and public safety data. Currently navigating challenges with aging infrastructure, critical hardware refresh cycles, and strict network modernization requirements within highly secure operational environments.[36]

The intersection of these stakeholders creates a complex procurement environment. While Secretary Savage and her leadership team at DoIT dictate the technical standards, architectures, and approved vendor lists, funding must survive the scrutiny of Chairs Guzzone and Barnes. Furthermore, while DoIT pushes for centralization, powerful agency CIOs retain significant influence over the specialized applications and specific operational technologies required for their unique missions.[8] Vendor engagement in Maryland therefore requires a dual-track approach: establishing technical alignment with DoIT's enterprise architects while simultaneously building business value cases with agency-level operational leaders and legislative appropriators.

3. IT Governance & Service Delivery Model

Operating Model: Transitioning to "Thoughtful Centralization"

Historically, the State of Maryland operated under a highly federated and siloed information technology model. Individual agencies procured, managed, and maintained their own bespoke technology environments, server rooms, and software applications.[8] Over time, this decentralized approach resulted in profound technical debt, overlapping and redundant software tools, inconsistent citizen experiences, and wildly disparate cybersecurity postures that posed significant risks to state data.[8]

Under the leadership of Secretary Katie Savage, the Department of Information Technology (DoIT) is aggressively pivoting toward a consolidated model characterized in the 2025 IT Master Plan as "thoughtful centralization".[8] This paradigm shift formally transitions DoIT from a passive utility provider into an active, strategic partner that builds technology capacity across the state government.[9]

The state is moving away from traditional project-based IT management toward a modern "product management" model, heavily influenced by federal methodologies like the United States Digital Service.[8] To execute this, DoIT has created specialized sub-agencies, such as the Maryland Digital Service, to bring product managers, user researchers, and software engineers in-house.[24] DoIT serves as the central broker and primary provider of enterprise IT support services, including the operation of networkMaryland (the highly cost-effective statewide fiber backbone), Voice Communications, statewide Identity & Access Management (IAM), and centralized endpoint management.[8] Agencies are now strictly expected to adopt DoIT's shared solutions for commodity IT—such as basic compute, storage, cloud hosting, and endpoint security. This centralization reduces the procurement and management burden on individual departments, allowing them to redirect their budgets and specialized personnel toward managing the small number of mission-critical, bespoke applications required for their specific mandates.[8]

Friction Points and the Chargeback Mechanism

The transition from a federated autonomy to a centralized governance model introduces

significant operational friction. DoIT utilizes a formal shared services model governed by standard Memorandums of Understanding (MOUs) signed with individual executive branch agencies.[40] Agencies access DoIT's comprehensive service catalog via a ServiceNow portal to procure resources, request support, or report security incidents.[40] DoIT then utilizes a complex chargeback model to recover costs for the consumption of these centralized services from the agencies' respective operating budgets.[40]

Several profound friction points exist within this evolving delivery model:

1. **Agency Resistance & Loss of Control:** Decentralized agencies with historically large budgets and complex mandates have traditionally preferred managing their own infrastructure to ensure agility.[33] Mandated consolidation forces these agencies to cede control of foundational infrastructure to DoIT. This transition often leads to internal debates over "build vs. buy" decisions, data sovereignty concerns, and the occasional emergence of shadow IT practices as agencies attempt to bypass central oversight.[42]
2. **Procurement Agility & Supply Chain Delays:** Agencies have expressed frustration over the speed and agility of centralized procurement. The reliance on DoIT to vet, approve, and provision hardware and cloud resources has sometimes created operational bottlenecks. Legislative budget documents explicitly note risks to project timelines stemming from significant delays in supplier delivery and the administrative overhead of funneling all requests through a central authority.[21]
3. **Financial Predictability & Budget Reconciliation:** The DoIT chargeback model requires agencies to accurately forecast their IT consumption years in advance during the budget formulation process. Unpredictable spikes in data storage requirements, increased cloud consumption, or emergency cybersecurity remediations can severely strain an agency's operating budget. Ensuring financial predictability and establishing credible cost estimates for shared services remains an ongoing challenge that causes friction during legislative budget hearings.[8]

4. Financials & Budget Breakdown

Total & IT Budget (FY25/FY26 & FY27 Trajectory)

The State of Maryland operates on a fiscal year that runs from July 1 through June 30. While the enacted state budget for FY 2025 and proposed FY 2026 hovered around $65 billion, demonstrating the administration's continued commitment to fiscal restraint amid structural deficit concerns, DoIT has seen substantial centralized funding increases.[3]

Looking ahead to the proposed FY 2027 budget, significant structural shifts are evident. The Maryland Benefits platform (formerly MD THINK) was transferred entirely to DoIT, accounting for $58 million in federal funds. Under the FY 2027 allowance, Maryland Benefits constitutes 24.7% of DoIT's entire budget, matching the 24.7% allocated to the Information Technology Investment Fund (ITIF).

Operational Spend (O&M):

Operational spending is categorized under the programmatic day-to-day management of infrastructure, personnel, and statewide cybersecurity. By FY 2026, DoIT's operational spend allocations included:

- **Infrastructure:** $72.2 million covering critical backbone services such as end-user applications, LAN/WAN support, and the operation and expansion of networkMaryland.[21]
- **Security Management:** $60.3 million to fund preventive approaches to protecting public information, operating the Maryland Security Operations Center (MDSOC), and enforcing new zero-trust policies.[21] A critical characteristic of Maryland's IT operation is its heavy reliance on the private sector. Combined contracts for operations, security, and capital projects account for roughly **84.4% of all DoIT spending**.[46]

Capital, Net-New Project Spend, & MITDP Execution Struggles: Net-new IT investments and massive modernization efforts are governed by the Information Technology Investment Fund (ITIF), which surged to $144.3 million in FY 2026.[46]

- **Major Information Technology Development Projects (MITDP):** These are complex projects with estimated costs over $5 million. While project funding is immense, project execution has faced severe recent friction. Legislative analysis of FY 2025 performance indicators reveals that only 55% of MITDPs were on schedule (down from 59% in FY24), and a mere 23% were spending within 10% of their planned budget (a sharp drop from 62%). In response, DoIT established a dedicated MITDP Oversight Division featuring specialized "Discovery" and "Intervention" teams to rein in failing projects.
- **Expedited Projects:** A newly created funding category with a $15 million allocation specifically designed for agile, rapid-deployment modernization efforts that bypass the heavier, multi-year bureaucratic hurdles associated with the traditional MITDP process.[46]

Grants & Funding Influxes

While the historic influx of federal American Rescue Plan (ARP) funds has been fully allocated by the state [47], Maryland is aggressively pursuing federal infrastructure and technology grants. The state allocated critical matching funds to compete for a $70 million federal tech hub grant for the Baltimore consortium.[11] State agencies extensively utilize federal matching funds for health and human services technology projects.[48]

At the municipal level, local governments are heavily supported by the State and Local Cybersecurity Grant Program (SLCGP). Maryland was awarded $6.4 million in FY23 (with a mandate that 25% goes to rural jurisdictions) and opened subsequent application periods in late 2024. These funds help municipalities fund cybersecurity projects and access Information Security Officer (ISO) shared services to comply with the state's minimum security standards necessary for connecting to the networkMaryland backbone.

5. Strategic Initiatives & Projects (Top 3)

1. Financial Management Information Systems (FMIS) Modernization

- **The Executive Mandate:** Driven by Comptroller Brooke Lierman and mandated by the 21st Century Financial Systems Council (established by 2023 legislation), this initiative aims to entirely replace the state's 30-year-old legacy accounting and procurement systems (known as ADPICS and R*STARS).[25] The core mandate focuses on increasing financial transparency, eliminating highly inefficient manual workflows, and drastically reducing the severe cybersecurity risks and technical debt associated with maintaining antiquated, siloed codebases.[25]
- **The Owning Agency:** The Office of the Comptroller serves as the business owner, acting in close technical partnership with DoIT, the Department of Budget and Management (DBM), and the Department of General Services (DGS).[26]
- **The Underlying IT Requirement:** The project requires a massive, multi-year transition to a modern, cloud-based Enterprise Resource Planning (ERP) platform. Technologically, this necessitates highly secure data migration protocols, robust unstructured and structured data classification to ensure data integrity, complex identity and access management (IAM) integration across all state entities, and scalable compute resources to support retraining and deployment across more than 100 state agencies.[25]

2. Maryland Benefits "One Application" & MD THINK Evolution

- **The Executive Mandate:** Governor Wes Moore's administration has prioritized citizen experience and digital equity as pillars of his tenure. The executive mandate is to unify highly fragmented health and human services platforms into a single, mobile-first digital gateway. This allows residents to apply for SNAP, Medicaid, TANF, WIC, and energy assistance simultaneously, rather than navigating disparate agency processes.[6] Beyond user experience, this modernization is a critical operational necessity to combat high SNAP overpayment rates that put the state at risk of federal penalties.[14]
- **The Owning Agency:** The Department of Information Technology (DoIT). The Board of Public Works approved the transfer of the Maryland Benefits platform directly to DoIT from DHS and MDH beginning in FY 2026, making DoIT the primary operator responsible for its cross-agency integration.
- **The Underlying IT Requirement:** Built upon the existing MD THINK cloud architecture, this project requires advanced data interoperability across historically entrenched agency silos.[12] It demands complex API management, massive storage scalability for constituent records, and low-latency compute for real-time application processing. Furthermore, the state's partnership with Anthropic requires a robust, secure, and highly governed underlying data architecture to support generative AI workloads without exposing sensitive constituent data.[12]

3. Statewide Zero-Trust Architecture & Infrastructure Modernization

- **The Executive Mandate:** Prompted by the Local Cybersecurity Support Act and executive orders, DoIT is enforcing an aggressive 18-month phased transition away from the state's legacy perimeter security model to a comprehensive zero-trust framework.[17]
- **The Owning Agency:** The Department of Information Technology, specifically the Office of Security Management and the Office of Infrastructure.[8]
- **The Underlying IT Requirement:** This initiative targets the complete overhaul of both physical and logical networks across the executive branch. Logically, it requires the deployment of continuous authentication protocols, micro-segmentation, and advanced endpoint detection and response (EDR) solutions across all state assets.[17] Physically, DoIT's Office of Infrastructure is concurrently executing a "fiber-first" approach to upgrade routers, core switches, and data center servers supporting networkMaryland.[8]

6. Procurement, Vendor Landscape, & Compliance

Procurement Strategies & Vehicles

Maryland's technology procurement process is highly regulated, designed to ensure competition, transparency, and the utilization of minority businesses. All formal solicitations are centralized through **eMaryland Marketplace Advantage (eMMA)**.[56] DoIT enforces stringent oversight on all technology purchases, actively identifying redundant agency spending and requiring departments to utilize state-sanctioned vehicles.[20]

The primary mechanisms for enterprise IT procurement are established Master Contracts, specifically the **Hardware Master Contract** and the highly utilized **IT Security Services and Solutions Master Contract**.[59] Agencies procure off these vehicles by issuing Purchase Order Requests for Proposals (PORFPs) to pre-qualified Master Contractors, which are typically regional and national Value-Added Resellers.[61]

Furthermore, to expedite procurement, the state officially leverages national cooperative purchasing agreements. Dell Technologies holds contracts through recognized vehicles such as NASPO ValuePoint, the National Cooperative Purchasing Alliance (NCPA), and PEPPM, which agencies can utilize for rapid fulfillment.[63] The administration has also prioritized systemic procurement reform aimed at expanding opportunities for Small Business Reserves (SBR) and Minority Business Enterprises (MBE), meaning OEMs must strategically partner with certified local integrators to win large deals.[10]

The Battlefield: Incumbents and Legacy Vulnerabilities

- **Hosting, Compute & Storage:** As part of earlier consolidation efforts, DoIT moved multiple agency data centers into centralized facilities managed by **TierPoint**.[65] Historically, DoIT has utilized all-flash storage arrays to overcome severe hardware issues and slow virtual machine restore speeds.[65] Dell EMC and Pure Storage have historically

competed aggressively for dominance in this centralized all-flash and hybrid-cloud storage space.[66]

- **Cloud Operations & Analytics:** The state relies heavily on Amazon Web Services (AWS) for hosting massive data lakes and application environments, particularly for the Maryland Benefits platform.[33]
- **Aging Infrastructure at the Edge:** Despite centralization efforts, decentralized agencies possess significant legacy hardware footprints that are failing. For example, local Capital Improvement Program (CIP) reports reveal that servers supporting critical Public Safety Communication Centers (PSCC) and Alternate Emergency 911 Communications Centers are nearly a decade old, experiencing increasing component failure rates that threaten uninterrupted emergency service.[68] Similarly, the Department of Public Safety and Correctional Services (DPSCS) has been repeatedly cited in legislative audits for IT network and hardware vulnerabilities.[37]

Compliance & Regulatory Drivers

- **StateRAMP / GovRAMP:** Maryland has officially transitioned to utilizing GovRAMP/StateRAMP standards for cloud security, meaning vendors providing SaaS/PaaS/IaaS processing state data must prove stringent compliance with NIST 800-53 controls via an independent 3PAO.[69]
- **Zero-Trust Mandate:** Hardware and software solutions must be capable of integrating into DoIT's new 31-module zero-trust framework.[17]
- **Maryland Online Data Privacy Act of 2024 (MODPA):** Taking effect in late 2025, MODPA imposes unprecedentedly strict requirements. Unlike traditional consent-based privacy laws, MODPA strictly limits data collection by controllers to only what is reasonably necessary to provide the service. Uniquely, it imposes an outright ban on the sale of sensitive data with no opt-in consent alternative. Furthermore, it mandates that agencies conduct privacy risk assessments for "each algorithm that is used" for activities posing a heightened risk. This fundamentally alters how unstructured data must be discovered and classified.
- **AI Governance (SB818):** Following Governor Moore's executive order, the state released its 2025 AI Enablement Strategy. IT infrastructure must now support responsible AI experimentation, ensuring strict data sovereignty, bias mitigation, and the provisioning of secure "sandboxes" for testing generative AI models.[72]

7. Actionable Dell Opportunities

Based on the strategic mandates, financial flows, and technical friction points identified in this analysis, the following sales motions represent high-probability, actionable whitespace opportunities for Dell Technologies.

Funded Alignment: Modernizing Core Infrastructure to Rescue MITDPs Given that only 23% of Major Information Technology Development Projects (MITDPs) stayed within 10% of

their planned budget in FY25, the state is struggling to control massive modernization costs for projects like the Comptroller's FMIS modernization and the Maryland Benefits portal.[25]

- **Action:** Position **Dell APEX** as the ideal bridge between DoIT's mandate for centralized financial predictability and the agencies' need for cloud-like agility. By offering APEX Custom Solutions, Dell can provide DoIT with on-premises cloud economics that satisfy StateRAMP and strict zero-trust security requirements, dramatically reducing the unpredictable cost overruns currently plaguing the state's MITDP portfolio.
- **Action:** Align **Dell PowerEdge** servers and **PowerStore** all-flash arrays directly to the state's "fiber-first" networkMaryland upgrades. As DoIT systematically replaces core routers and switches to improve backbone speeds [8], the back-end compute and storage environments residing in TierPoint facilities must scale proportionately.

Whitespace & Advisory: Taming Unstructured Data for AI and MODPA Compliance
Maryland's high-profile partnership with Anthropic relies entirely on the quality and security of its underlying data.[12] Concurrently, MODPA introduces severe legal liabilities, including an outright ban on selling sensitive data and the unprecedented requirement to assess "each algorithm" used. The state's vast unstructured data sprawl is a massive strategic blind spot.

- **Action:** Lead with **Dell Advisory Services** targeting State Chief Data Officer Natalie Evans Harris. Position **Dell PowerScale (Isilon)** and Data Confidence Fabric solutions as essential data governance platforms. Demonstrate how Dell's unstructured storage solutions provide the telemetry and automated data tagging necessary to discover and classify sensitive PII, ensuring immediate compliance with MODPA's strict minimization mandates while preparing the data foundation for algorithmic assessments and generative AI pilots.

Competitive Displacement: Rip-and-Replace of Aging Edge and Public Safety IT
Decentralized agencies are currently struggling with end-of-life hardware that not only threatens public safety operations but repeatedly triggers highly visible legislative audit findings.[14]

- **Action:** Leverage the **$6.4 million SLCGP funding pool** to execute a targeted rip-and-replace campaign within local municipal 911/CAD centers. Highlight the catastrophic operational risk of running decade-old servers for emergency dispatch.[68] Position **VxRail** hyperconverged infrastructure and ruggedized **PowerEdge XR series** edge servers to drastically consolidate physical footprints and deliver the high-availability zero-trust infrastructure required to win SLCGP grant approvals.
- **Action:** Challenge the incumbent hyperscaler (AWS) footprint within the Maryland Benefits environment. As DoIT takes over the portal to serve millions of constituents, pure public cloud consumption costs will inevitably spike. Dell should proactively engage DoIT IT leadership to conduct a comprehensive Total Cost of Ownership (TCO) analysis, positioning a hybrid-cloud repatriation strategy using **Dell ECS** and **PowerProtect** to secure sensitive constituent data on-premises at a lower, highly predictable cost.
